## Case Study
### CBTS managed AWS environment for services in Government

## Client
### A healthcare information systems company

The client develops and supports mission-critical healthcare information systems in the Mental Health, Long Term Care, Community and Social Service, and Hospital sectors for over 200 clients in North America. The client solutions include Blockchain, Mobile, and Web-Based Assessment and Electronic Health Record solutions. The client is headquartered in Toronto, Canada where they provide services to the region.

Cloud, covered.
Challenge

VitalHub was contracted by the Canadian province of Nova Scotia to host and manage a healthcare solution for those in NS. VitalHub wanted a solution that could be quickly relaunched and deployed in the case of a disaster. Because of Nova Scotia’s government regulations, this solution had to have 100% of its data stored within Canada, in addition, to support personnel being Canadian Citizens. In addition, there were more stringent security concerns, and the solution would be required to deploy a Web Application Firewall, Intrusion Prevention System, strict firewall rules, and only accessible via a client VPN.

VitalHub had an AWS priority for this environment as it is an approved platform for the government. AWS supports the Canadian region with two availability zones that, in the event of a disaster, the application can be recovered in the secondary location with minimal impact. AWS would eliminate the need to maintain and host a local data center, instead, VitalHub would be able to take advantage of the CBTS managed cloud computing model of resource use.

CBTS solution

VitalHub required that the AWS environment be configured similarly to their on-premises environment. Reserved EC2 instances were used to provide the same architecture and a cheaper cost compared to on-demand resources. All web requests going into the environment first pass through a Fortigate appliance and AWS Web Application Firewall / Application Load Balancer before reaching the production or test web server.

CBTS provided a number of security features to the VitalHub solution’s environment:

- **AWS WAF.** A Web Application Firewall was set up for both production and test environments. This WAF is configured to use Fortinet’s managed ruleset to protect against the complete OWASP top 10 web application threats. In addition, the WAF was configured to only allow access for those users not in the Canada geographic region.

- **IPS.** A Fortigate cloud appliance was deployed in VitalHub’s AWS environment for all incoming traffic to pass through and provide an Intrusion Protection System.

- **AWS Canada Region.** All data and services are hosted in AWS’s ca-central-1 region, ensuring data remains in Canada at all times.

- **Client VPN.** All-access to the environment by VitalHub is done through Forticlient VPN, which connects to Fortigate and allows only certain AD users to connect.

- **Trend Micro AV.** CBTS managed Trend Micro Antivirus provides protection for the VitalHub servers.

The VitalHub AWS environment is regularly backed up via snapshots of the EC2 instances’ EBS volumes. These snapshots will be used in order to re-stand up the environment in the case of disaster. This process was automated through Terraform, only requiring a small number of changes to re-launch the environment, in the same manner, it was provisioned in the failing availability zone.

Results

VitalHub’s AWS efficient public cloud environment is currently live and functional in AWS while following best practices. Phase 1 of the infrastructure has been wholly deployed, while more phases, which provide such things as load-balanced web servers, will be built out in time. A Well-Architected Review was conducted on the VitalHub AWS environment providing important key items to evaluate and improve on by CBTS and VitalHub.

A disaster recovery test is prepared and ready for deployment - additional public IP addresses and a Terraform codebase is ready for a parallel deployment in AWS to ensure, in the event of a disaster, a smooth and quick recovery will be made.

By working with CBTS, VitalHub can meet the needs of an important government agency, mirror their current application and infrastructure environment, and rest assured that the environment is built on the highest of industry standards.
